Design Of Experiments For Engineers

Design of Experiments (DOE) is a methodology that can be effective for general problem-solving, as well as for improving or optimizing product design and manufacturing processes. Specific applications of DOE include identifying proper design dimensions and tolerances, achieving robust designs, generating predictive math models that describe physical system behavior, and determining ideal manufacturing settings.

Design of Experiments (DOE) for Engineers

Design of Experiments for Engineers and Scientists overcomes the problem of statistics by taking a unique approach using graphical tools. The same outcomes and conclusions are reached as through using statistical methods and readers will find the concepts in this book both familiar and easy to understand.

DoE pioneer George Box developed a clever experiment that led to the discovery of a highly corrosion-resistant coating for steel bars [5]. Four different coatings (C1-C4) were tested (which is easy to do) at three different furnace temperatures (which is hard to change), and each experiment was run twice to provide statistical power.
